Place spindle lock spring (11) into the spring retaining area on the gearcase (27), as shown. Press ball bearing (9b) to the shoulder on the armature shaft (9). Orient the spindle lock (10) onto the armature shaft, inbetween the pressed on bearing and the front of the fan, as shown. Carefully insert the armature pinion/bearing into the gearcase. Align the spindle lock with the channel in the gearcase, making sure that the tab on the spindle lock engages the front of the spring.

Orient the washer (40) such that the rounded edge is towards the depth rail of the shoe assembly (41).

Verify that the hex head bolt (28) is fully seated in the gearcase (27) while assembling the depth shaft (39), as shown.

Press the bearing (29) flush to .015" subflush to the gear cavity wall in the gearcase (27).

When servicing, remove 90-95% of the existing grease prior to installing Type 'Y' grease. Original grease maybe similar in color but not compatible with 'Y'.

LUBRICATION

Type 'Y' Grease, No. 49-08-5270

Note: Approx. 20 grams (.7 oz.) will be used

- Place a light coat of grease on the lower guard shaft (17) before assembling into the gearcase hole. (Approx. 1g/.035oz.)
- Coat o-ring (12) with grease prior to installing in groove of bearing cavity of gearcase (27). Coat bearing cavity (with o-ring installed) with grease prior to installing ball bearing (9b). (Approx. 2g/.07oz.)
- Place a heavy coating of grease over and around all teeth of the pinion gearing of the armature (9). (Approx. 2g/.07oz.)
- Place 9-11 grams (.32-.39oz.) of grease into the gear cavity of gearcase (27) prior to installing the service hub assembly (44).
- Place a heavy coating of grease over and around all of the teeth of the gear of the service hub assembly. (Approx. 3g/.1oz.)
- Coat the outside surface of needle bearing (29) and the needle bearing cavity of gearcase (27) with grease. (Approx. 1g/.035oz.)

Orient the textured gripping surface of the lower guard lever (16) so it is parallel ($\pm 20^\circ$) with the back edge of the front handle (15), as shown.

Functionally check the lower guard (47), with the saw set at full depth of cut. Place the saw upside down with the shoe (41) horizontal. Retract the lower guard 100%. Release the lower guard lever (16). The guard should return in a brisk manner.

When tight, the depth adjustment lever (38) should be parallel ($\pm 20^\circ$) with the shoe (41).

Secure the ring terminal from the long white motor wire to the bottom left position on the on-off switch using switch screw

Black leadwire assembly (23-94-1220). Connect push on terminal to the tab on the overload protector as shown. On the other end of the wire assembly, secure ring terminal to upper left position of on-off switch using switch screw

Terminal from short black motor wire to connect to overload protector as shown

This cord wire is black for 120V tools and brown for 220-240V. Secure to upper right position of the on-off switch with switch screw

Sleeved motor wires

Overload Protector Orient with terminal tabs facing upward (Screen printing facing up)

On-Off Switch

Capacitor (Not used in all models)

Black Leadwire Assembly 23-94-1220

This cord wire is white for 120V tools and blue for 220-240V. Secure to lower right position of the on-off switch with switch screw

White motor wire

Cord wire- Black for 120V tools and brown for 220-240V tools.

Power Cord to extend .125 minimum beyond the clamping area in handles

Capacitor (Not used in all models)

Cord wire- White for 120V tools and blue for 220-240V tools.

Black motor wire to carbon brush holder

Black motor wire to carbon brush holder
